## General PSA Generation System Layout

A typical Industrial Nitrogen Generation system consists of three parts:

- Compressed Air System: Air Compressor, Pre-filter, Air Dryer, Dry Air Vessel
- PSA $N_2$ Generator
- Nitrogen Storage Tank

| | |
|---|---|
| **Air Compressor** | An Air compressor is used to compress the atmospheric air to a pressure required for the separation of **Nitrogen** from the air. |
| **Refrigeration dryer** | Compressed air then passes through a refrigerated dryer to remove moisture (which is harmful to sieves) from the air. |
| **Air Tank** | Dry air is collected in an air tank to remove the pulsations which serve the dynamic (changing) requirement of air by the PSA system. |
| **Multistage Filtration system** | Before air enters the PSA system, it is passed through multistage filtration removing moisture, particulates and oil content to the specified levels. |
| **PSA system** | Pressurized air is passed through PSA Towers filled with Molecular sieves to separate **Nitrogen** from Air. |
| **Storage Tank** | Industrial Grade **Nitrogen** produced from PSA system is stored in this tank for continuous supply. |
| **Oxygen Analyser** | Nitrogen produced is monitored by an Oxygen analyser. In case, $O_2$ impurity goes above the specified level, it gives an alarm and switches the plant to vent mode. |
