Industrial PSA Oxygen Generator

PSA Technology

PSA Process explaining oxygen production

Industrial Oxygen Generator mainly consists of two adsorbers filled with zeolite molecular sieves. Pressurized air is passed through one of these adsorbers, zeolite having a property to attract nitrogen, adsorbs Nitrogen from air and oxygen is allowed to pass through and move into the storage tank as the final product. As the adsorber approaches saturation, the air is allowed to pass through the other adsorber while this adsorber is being regenerated to ensure a continuous supply of Oxygen. This changeover takes place through a specially designed microcontroller to ensure a hassle-free operation. The quality of oxygen produced is monitored by an Oxygen analyser.

Equipment Description

The Industrial Oxygen Generator consists of

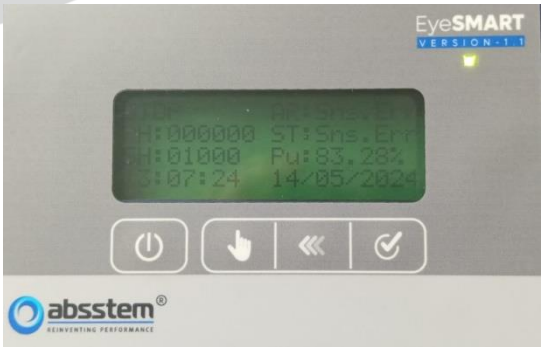

Air Compressor	An Air compressor is used to compress the atmospheric air to a pressure required for the separation of **Oxygen** from the air.
Refrigeration dryer	Compressed air then passes through a refrigerated dryer to remove moisture (which is harmful to sieves) from the air.
Air Tank	Dry air is collected in an air tank to remove the pulsations which serve the dynamic (changing) requirement of air by the PSA system.
Multistage Filtration system	Before air enters the PSA system, it is passed through multistage filtration removing moisture, particulates and oil content to the specified levels.
PSA system	Pressurized air is passed through PSA Towers filled with Molecular sieves to separate **Oxygen** from Air.
Storage Tank	Industrial Grade **Oxygen** produced from IDOS C is stored in this tank to supply a continuous flow of **Oxygen**.
Oxygen Analyzer	Oxygen produced is monitored by an **Oxygen** analyser. In case, O2 purity goes below the specified level, it gives an alarm and switches it to vent mode.
